

# Sillimanite ( $\text{Al}_2\text{SiO}_5$ , $S0_3$ ) Structure: A2B5C\_oP32\_62\_ac\_3cd\_c-001

This structure originally had the label A2B5C\_oP32\_62\_bc\_3cd\_c. Calls to that address will be redirected here.

Prototype	$\text{Al}_2\text{O}_5\text{Si}$
AFLOW prototype label	A2B5C_oP32_62_ac_3cd_c-001
Strukturbericht designation	$S0_3$
Mineral name	sillimanite
ICSD	85200
Pearson symbol	oP32
Space group number	62
Space group symbol	$Pnma$
AFLOW prototype command	<code>aflow --proto=A2B5C_oP32_62_ac_3cd_c-001 --params=a, b/a, c/a, x2, z2, x3, z3, x4, z4, x5, z5, x6, z6, x7, y7, z7</code>

- Three crystal polymorphs of  $\text{Al}_2\text{SiO}_5$  have been characterized, all with Al octahedra and chains of edge-sharing  $\text{SiO}_6$  tetrahedra:
  - kyanite ( $S0_1$ ), space group  $P\bar{1}$  #2,
  - andalusite ( $S0_2$ ), space group  $Pnnm$  #58, and

- sillimanite ( $S0_3$ ), space group  $Pnma$  #62 (this structure).
- We use the ambient pressure data of (Yang, 1997).
- (Yang, 1997) give the Wyckoff positions in the  $Pbnm$  setting of space group #62. We use FINDSYM to transform this to the standard  $Pnma$  setting. This involves a rotation of the principle axes and a shift of the set of aluminum atoms from the (4a) to the (4b) Wyckoff position.
- (Hermann, 1937) defined this as  $S0_3$ , but also listed it as  $H5_2$  in the index.

### Simple Orthorhombic primitive vectors

### Basis vectors
