- Aurivillius phases are layered tetragonal materials with composition $(Me'_2O_2)^{2+}(Me_{m-1}R_mO_{3m+1})^{2-}$ $(Me_{m-1}Me'_2R_mO_{3(m+1)})$, where Me and Me' are metals and R is a transition metal with a charge of +4 or +5. (Subbaro, 1962)
- This is the original structural determination by (Aurivillius, 1949). The niobium and titanium atoms equally occupy the same (8g) site. We have arbitrarily labeled this as "Nb."
- Crystals such as $BaBi_2Nb_2O_9$ put the non-bismuth atom on the (4a) site, and the niobium site can be occupied by niobium, tantalum, and/or titanium. (Aurivillius, 1949)
- We have swapped Aurivillius's x- and z-axes.
