- Ni₄B₃ is found in two forms (Rundqvist, 1967):
 - This orthorhombic structure, and
 - a monoclinic structure.
- While the monoclinic structure is stoichiometric, with chains of boron atoms, the composition of the orthorhombic phase is Ni₄B_{3-x}, with vacancies on the boron sites. The exact phase depends on the stoichiometry.
- Orthorhombic Ni₄B₃ and Rh₄P₃ have the same AFLOW prototype label, A3B4_oP28_62_3c_4c. They are generated by the same symmetry operations with different sets of parameters (`--params`) specified in their corresponding CIF files.
