- Ni(H<sub>2</sub>O)<sub>6</sub>SnCl<sub>6</sub> is the prototype for a large class of molecular crystals with the form MG<sub>6</sub>LR<sub>6</sub>, where MG<sub>6</sub> is a cation and LR<sub>6</sub> is an anion. (Hermann, 1937) gave this the *Strukturbericht* designation *I*6<sub>1</sub>. (Gottfried, 1937) changed the *I* designations to *J*, so this should have become *J*6<sub>1</sub>, but it was never referenced in any form in later volumes of *Strukturbericht*. Since *I*6<sub>1</sub> is the only designation for this structure in the literature, we use it rather than *J*1<sub>6</sub>.
